According to the AAP committee, genetic research has accelerated the discovery of individual genes and enhanced our understanding of how gene abnormalities can lead to disease. Results from previous studies demonstrated that recombinant IL-2 boosted immunity levels in a small group of patients with HIV on antiretroviral drug therapy; however, concern was raised as to whether it increased the amount of HIV in the blood. 1980;303:360±ÅAAA70.Page 3Joanne E. 1999-94(4):479±ÅAAA88.16. These tests can also be used for the screening based on the population to predict future genetic diseases or evaluate the risk of complex conditions such as cancer, cardiovascular diseases and neurodegenerative disorders in people who are apparent healthy. The AAP declaration provides background information; discusses the various types of molecular tests, including indirect analyzes, analysis of direct mutation and molecular cytogenetic analysis; SOPES the benefits and risks of molecular diagnosis; Although the AAP position declaration focuses on molecular genetic tests that can be used to diagnose many genetic disorders, the committee emphasizes that this type of technology may not be appropriate for the diagnosis of all, or even Most, genetic conditions.
